

ABSTRACT

A method and apparatus for analyzing data from remote monitoring equipment, such as patient telemetry devices, and
5 determining (i) whether an anomalous event has occurred, (ii) if an anomalous event has occurred, whether a physician should be contacted, and (iii) if a physician should be contacted, selecting the physician to contact. Further, the system operates in parallel, in that a plurality of experts (e.g. physicians) may be contacted in response to a
10 single or multiple anomalous events, thus ensuring an efficient response to an anomalous event.
